Psychological Battery Analysis – Interview 1

Participant Information

- Age: 18
- Interview Topic: Emotional well-being, loneliness, stress, and social media impact

1. Loneliness Assessment

The participant reported feeling lonely mainly during classes and when spending time alone without friends. The loneliness appears to be situational rather than constant, as it is linked to specific environments such as classrooms and social settings where the participant feels a lack of companionship.

Interpretation:
This suggests social loneliness rather than emotional isolation. The participant likely has social interaction needs that are not fully met in academic environments.

2. Stress and Emotional Pressure

The participant identified the following sources of stress:

- Academic pressure
- Deadlines
- Overthinking about the future
- Situations not going as planned

Interpretation:
This indicates academic stress combined with future anxiety and overthinking tendencies. The participant may have performance-related stress and uncertainty about long-term goals.

3. Social Support System

The participant reported sharing problems mostly with family members, especially parents.

Interpretation:
This suggests the participant has a strong family support system and is comfortable seeking emotional support from family, which is a positive protective psychological factor.

4. Social Media Impact

The participant reported that social media sometimes makes them feel less accomplished when comparing their life to others.

Interpretation:
This indicates social comparison behavior, which may lead to reduced self-esteem and feelings of inadequacy.

5. Coping Mechanisms

When feeling sad or overwhelmed, the participant:

- Plays games
- Listens to music
- Spends time alone thinking

Interpretation:
These are emotional coping strategies and distraction-based coping methods. They help temporarily reduce stress but may not directly solve underlying problems.

6. Help-Seeking Behaviour

The participant advised others to talk to someone they trust and ask for help, which indicates awareness of emotional health and the importance of communication.

Interpretation:
The participant has healthy help-seeking attitudes and emotional awareness.

Overall Psychological Summary – Interview 1

The participant shows:

- Situational loneliness
- Academic and future-related stress
- Strong family support
- Social comparison effects from social media
- Uses distraction-based coping strategies
- Emotionally aware and willing to seek help

Conclusion:
Overall, the participant appears emotionally stable with moderate academic stress and occasional loneliness, but strong family support and willingness to communicate act as protective factors for emotional well-being.

Psychological Battery Analysis – Interview 2

Participant Information

- Age: 15
- Interview Topic: Emotional well-being, loneliness, stress, and social media impact

1. Loneliness Assessment

The participant reported feeling lonely:

- At night
- When alone for long periods
- When surrounded by people but not emotionally connected

Interpretation:
This indicates emotional loneliness rather than physical loneliness. The participant may feel disconnected even in social environments, suggesting a lack of deep emotional connections.

2. Stress and Emotional Pressure

The participant reported stress due to:

- Deadlines
- Feeling not good enough compared to others

Interpretation:
This suggests performance pressure and self-comparison stress, which may affect self-esteem and confidence.

3. Emotional Expression

The participant reported that they usually keep problems to themselves and only occasionally talk to one close friend.

Interpretation:
This indicates emotional suppression and limited emotional expression, which may lead to internalized stress.

4. Social Media Impact

The participant stated that seeing others doing well on social media makes them question themselves even though they know social media does not show the full reality.

Interpretation:
This shows awareness but still emotional impact from social comparison, which may contribute to self-doubt.

5. Coping Mechanisms

When feeling sad or overwhelmed, the participant:

- Listens to music
- Sits quietly and thinks
- Writes thoughts down

Interpretation:
These are reflective coping strategies and emotional processing methods. Writing thoughts is a healthy coping mechanism often used for emotional regulation.

6. Social Support System

The participant believes friends and family would support them but does not always reach out for help.

Interpretation:
Support system exists, but help-seeking behavior is low. The participant may prefer handling problems independently.

Overall Psychological Summary – Interview 2

The participant shows:

- Emotional loneliness
- Self-comparison and self-doubt
- Emotional suppression
- Reflective coping strategies (writing, thinking)
- Low help-seeking behavior
- Values meaningful conversations and emotional connection

Conclusion:
The participant appears emotionally introspective but may internalize stress and loneliness rather than expressing it openly. Although coping strategies are relatively healthy, reduced help-seeking behavior and emotional loneliness may increase emotional vulnerability.

Interview 3 – Analysis

Participant Overview

The participant is an 18-year-old individual who appears to be socially active and emotionally aware. The participant does experience loneliness and stress but seems to have a support system and healthy coping mechanisms.

Loneliness

The participant stated that they do feel lonely sometimes, especially:

- When they are away from friends for a long time
- When plans get cancelled
- When they feel left out
- When everyone is busy and they have no one to talk to

This suggests that their loneliness is **situational and social**, not constant. Their emotional state depends largely on social interaction and connection with others.

Stress and Emotional Low Feelings

The main causes of stress mentioned were:

- Too many responsibilities at once
- When things do not go as planned

This shows that the participant may experience **pressure from responsibilities and expectations**, and they may struggle with situations that are outside their control.

Sharing Problems

The participant mentioned that they are comfortable sharing problems and usually talk to:

- Best friends
- Family members

This indicates that the participant has **good communication and emotional support**, which is an important factor for emotional well-being.

Social Media Impact

The participant said social media sometimes makes life feel like a competition, but they try not to take it too seriously.
This shows that the participant is **aware of the negative effects of social comparison** and tries to manage those feelings.

Coping Mechanisms

When feeling sad or overwhelmed, the participant:

- Goes out
- Talks to friends
- Watches movies
- Listens to music
- Keeps themselves busy

These are **healthy coping strategies**, especially social interaction and engaging in enjoyable activities.

Support System

The participant feels supported by friends and family and mentioned that people:

- Check in on them
- Listen to them

This indicates a **strong support system**, which reduces emotional distress and loneliness.

Advice Given

The participant advised that people who feel lonely or depressed should:

- Reach out to others
- Not deal with everything alone
- Avoid comparing their life to others

This advice reflects **emotional maturity and awareness**.
