

ANALYSIS – Based on Psychological Battery

Name: Sloka Duggi

Project: Design Thinking – Mental Health and Loneliness

Psychological Battery Analysis – Interview 1

Participant Information

Age: 18

Name: Akshara

Interview Topic: Emotional Well-being, Loneliness, Stress, and Social Media Impact

1. Loneliness Assessment

The participant reported feeling lonely when spending too much time alone or when friends are unavailable.

Interpretation:

This indicates situational loneliness, where feelings of loneliness arise due to temporary social disconnection rather than long-term emotional isolation.

2. Stress and Emotional Pressure

The participant identified the following sources of stress:

- Academic pressure
- Deadlines and assignments
- Concerns about the future

Interpretation:

This reflects academic and future-oriented stress. The participant experiences pressure related to educational performance and uncertainty about future goals.

3. Social Support System

The participant stated that they usually share their problems with trusted friends.

Interpretation:

This suggests the presence of a reliable support system and a willingness to seek emotional support when needed.

4. Social Media Impact

The participant reported comparing themselves to others on social media.

Interpretation:

This indicates social comparison behavior, which may contribute to reduced self-confidence and feelings of inadequacy.

5. Coping Mechanisms

When feeling overwhelmed, the participant:

- Listens to music
- Watches videos
- Engages in hobbies

Interpretation:

These are relaxation-based coping strategies that help reduce emotional distress and improve mood.

6. Help-Seeking Behaviour

The participant is comfortable reaching out to trusted individuals during difficult times.

Interpretation:

This demonstrates positive help-seeking behavior and emotional awareness.

Overall Psychological Summary – Interview 1

The participant shows:

- Situational loneliness
- Academic and future-related stress
- Strong social support
- Social media comparison tendencies
- Healthy coping mechanisms
- Positive help-seeking behavior

Conclusion:

The participant appears emotionally stable and resilient. While academic stress and social comparison occasionally affect well-being, strong social connections and healthy coping strategies contribute positively to emotional health.

Psychological Battery Analysis – Interview 2

Participant Information

Age: 18

Name: Aashritha

Interview Topic: Emotional Well-being, Loneliness, Stress, and Social Media Impact

1. Loneliness Assessment

The participant reported feeling lonely when feeling misunderstood or emotionally disconnected from others.

Interpretation:

This suggests emotional loneliness, where the need for deeper emotional connection is not fully satisfied.

2. Stress and Emotional Pressure

The participant reported stress due to:

- Examinations
- Family expectations
- Overthinking

Interpretation:

This reflects performance-related stress combined with internal pressure and excessive self-reflection.

3. Emotional Expression

The participant shares problems only with a few trusted people.

Interpretation:

This indicates selective emotional expression and a tendency to process emotions internally before seeking support.

4. Social Media Impact

The participant acknowledged comparing personal progress with others online.

Interpretation:

This demonstrates awareness of social comparison, which may occasionally lead to self-doubt and reduced self-esteem.

5. Coping Mechanisms

When feeling overwhelmed, the participant:

- Takes walks
- Listens to music
- Spends time reflecting

Interpretation:

These coping strategies help regulate emotions and provide temporary relief from stress.

6. Social Support System

The participant receives support from close friends and family.

Interpretation:

Although support is available, the participant tends to seek it selectively.

Overall Psychological Summary – Interview 2

The participant shows:

- Emotional loneliness
- Overthinking tendencies
- Moderate help-seeking behavior
- Social comparison effects
- Reflective coping strategies
- Strong need for emotional connection

Conclusion:

The participant appears thoughtful and emotionally aware but may be vulnerable to self-doubt and overthinking. Meaningful relationships and emotional support play an important role in maintaining well-being.

Psychological Battery Analysis – Interview 3

Participant Information

Age: 18

Name: Havish

Interview Topic: Emotional Well-being, Loneliness, Stress, and Social Media Impact

1. Loneliness Assessment

The participant reported feeling lonely when separated from friends or when there is no one available to talk to.

Interpretation:

This indicates situational loneliness that is closely linked to social interaction and companionship.

2. Stress and Emotional Pressure

The participant identified the following stressors:

- Heavy workload
- Lack of sleep
- Uncertainty about the future

Interpretation:

This reflects situational stress caused by balancing responsibilities and personal expectations.

3. Social Support System

The participant stated that they openly communicate with close friends and family.

Interpretation:

This indicates a strong support network and healthy emotional communication patterns.

4. Social Media Impact

The participant reported that social media occasionally creates pressure and unrealistic expectations.

Interpretation:

This suggests awareness of social media influences while maintaining reasonable control over its emotional effects.

5. Coping Mechanisms

When feeling overwhelmed, the participant:

- Exercises
- Plays games
- Talks to friends

Interpretation:

These are active and social coping strategies that effectively reduce stress and improve emotional well-being.

6. Help-Seeking Behaviour

The participant actively seeks support when experiencing difficulties.

Interpretation:

This demonstrates healthy emotional expression and strong help-seeking behavior.

Overall Psychological Summary – Interview 3

The participant shows:

- Situational loneliness
- Stress related to responsibilities
- Strong social support system
- Active coping strategies
- Positive communication habits
- Healthy help-seeking behavior

Conclusion:

The participant appears emotionally balanced and socially connected. Strong interpersonal relationships and proactive coping methods contribute significantly to overall emotional well-being.

This is in almost the same academic style as the sample document and should fit directly into your Design Thinking report.
